

# **DISTRIBUTED SYSTEMS**

## **CS6421**

# **CONSISTENCY AND REPLICATION**

Prof. Tim Wood and Prof. Roozbeh Haghnazan

Includes material adapted from Van Steen and Tanenbaum's Distributed Systems book

# FINAL PROJECT

Questions?

- Design Document
  - Proposed Design
  - UML Diagrams describing architecture and communication
  - Work timeline with breakdown by team member
- Schedule meetings with us!
- Timeline
  - Milestone 0: Form a Team - 10/12
  - Milestone 1: Select a Topic - 10/19
  - Milestone 2: Literature Survey - 10/29
  - **Milestone 3: Design Document - 11/5**
  - Milestone 4: Final Presentation - 12/14

<https://gwdistsys20.github.io/project/>

# LAST TIME...

- Fault Tolerance
  - Types of Failures
  - Two Generals Problem
  - Fault Tolerance Algorithms
  - Centralized FT: Raft/Paxos

# THIS TIME...

- Replication and Consistency
  - Why replicate
  - What is consistency?
  - Consistency Models
  - Quorum Replication

Next Time: Exam!

# DISTSYS CHALLENGES

- **Heterogeneity**
- Openness
- **Security**
- **Failure Handling**
- Concurrency
- **Quality of Service**
- **Scalability**
- **Transparency**

Any questions about these? You will need to relate your project to them and they will be on the exam!

# PROBLEM

- Given that synchronization and locking is so difficult, do we really need it in a distributed system?
- Is there a better way?

# REASONS FOR REPLICATION

- Data are replicated to increase the reliability of a system.
- Replication for performance
  - Scaling in numbers
  - Scaling in geographical area
- Caveat
  - Gain in performance
  - Cost of increased bandwidth for maintaining replication

# REASONS FOR REPLICATION

- Reliability.
- Performance.
- Replication is the solution.

How do we keep them up-to-date?  
How do we keep them consistent?

# MORE ON REPLICATION

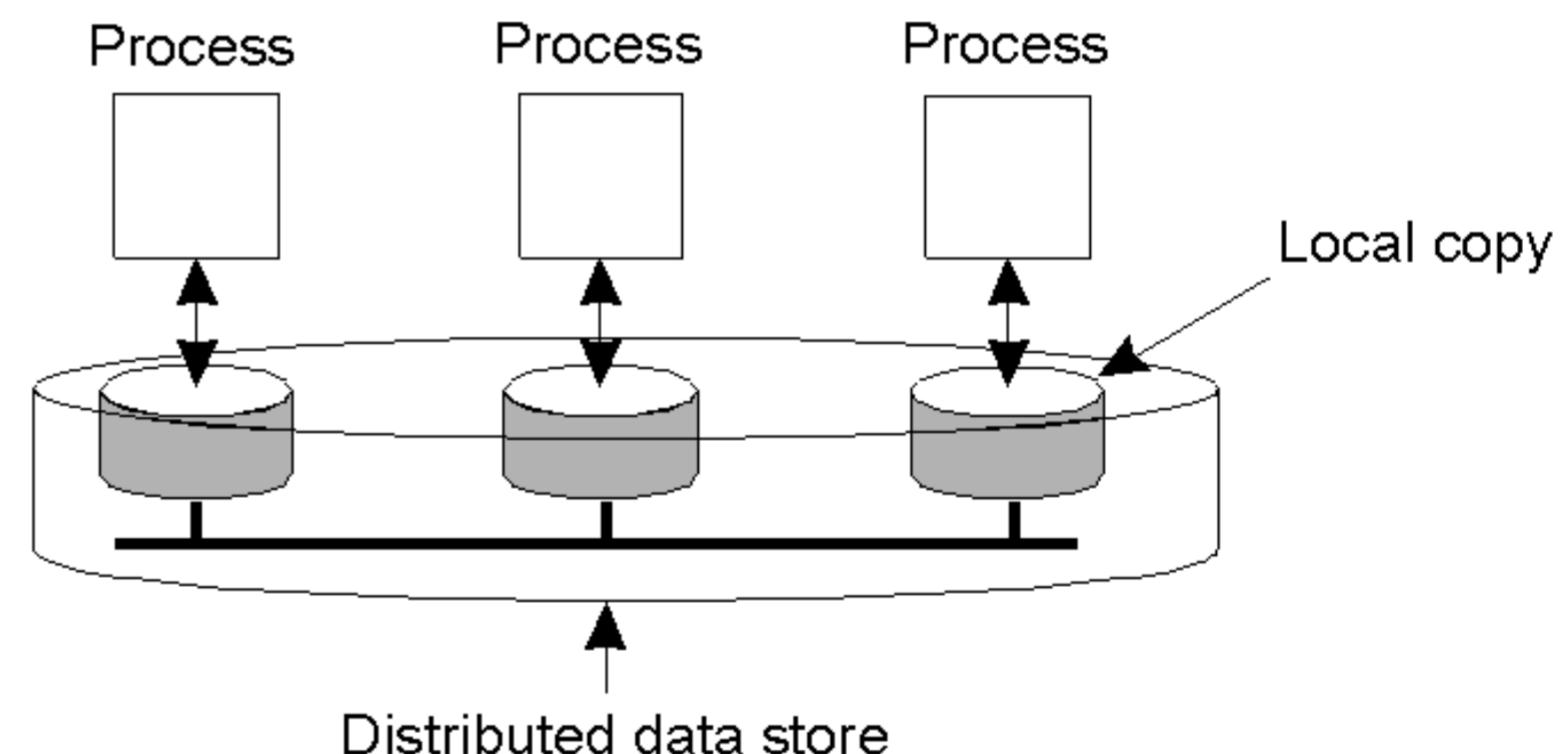

- Replicas allows remote sites to continue working in the event of local failures.
- It is also possible to protect against data corruption.
- Replicas allow data to reside close to where it is used.
- This directly supports the distributed systems goal of enhanced scalability.
- Even a large number of replicated “local” systems can improve performance: think of clusters.
- So, what’s the catch?
- It is **not easy** to keep all those replicas **consistent**.

# CONSISTENCY MODELS

- What is a consistency model?
  - It is an agreement and contract between a distributed data store and related processes.
- Data-Centric
  - Continuous
  - Consistent ordering of operation
    - Sequential
    - Causal
- Client-Centric

# DATA-CENTRIC CONSISTENCY MODELS

- A data-store can be read from or written to by any process in a distributed system.
- A local copy of the data-store (replica) can support “fast reads”.
- However, a write to a local replica needs to be propagated to *all* remote replicas.

# CONTINUOUS CONSISTENCY

- There are different ways for applications to specify what inconsistencies they can tolerate.
- Yu and Vahdat [2002] take a general approach by distinguishing three independent axes for defining inconsistencies:
  - deviation in numerical **values** between replicas
  - deviation in **staleness** between replicas
  - deviation with respect to the **ordering** of update operations
- They refer to these deviations as forming **continuous consistency** ranges.

# EXAMPLE OF NUMERICAL DEVIATIONS

Company	Stock price
Apple	\$1100.00

Company	Stock price
Apple	\$1100.00 +0.03

Company	Stock price
Apple	\$1100.00 +0.03

# CONTINUOUS CONSISTENCY

- Each replica server maintains a two-dimensional vector clock

Replica A

Conit	d = 558 // distance g = 95 // gas p = 78 // price
Operation	Result
< 5, B>	g $\leftarrow$ g + 45 [ g = 45 ]
< 8, A>	g $\leftarrow$ g + 50 [ g = 95 ]
< 9, A>	p $\leftarrow$ p + 78 [ p = 78 ]
<10, A>	d $\leftarrow$ d + 558 [ d = 558 ]

Vector clock A = (11, 5)  
Order deviation = 3  
Numerical deviation = (2, 482)

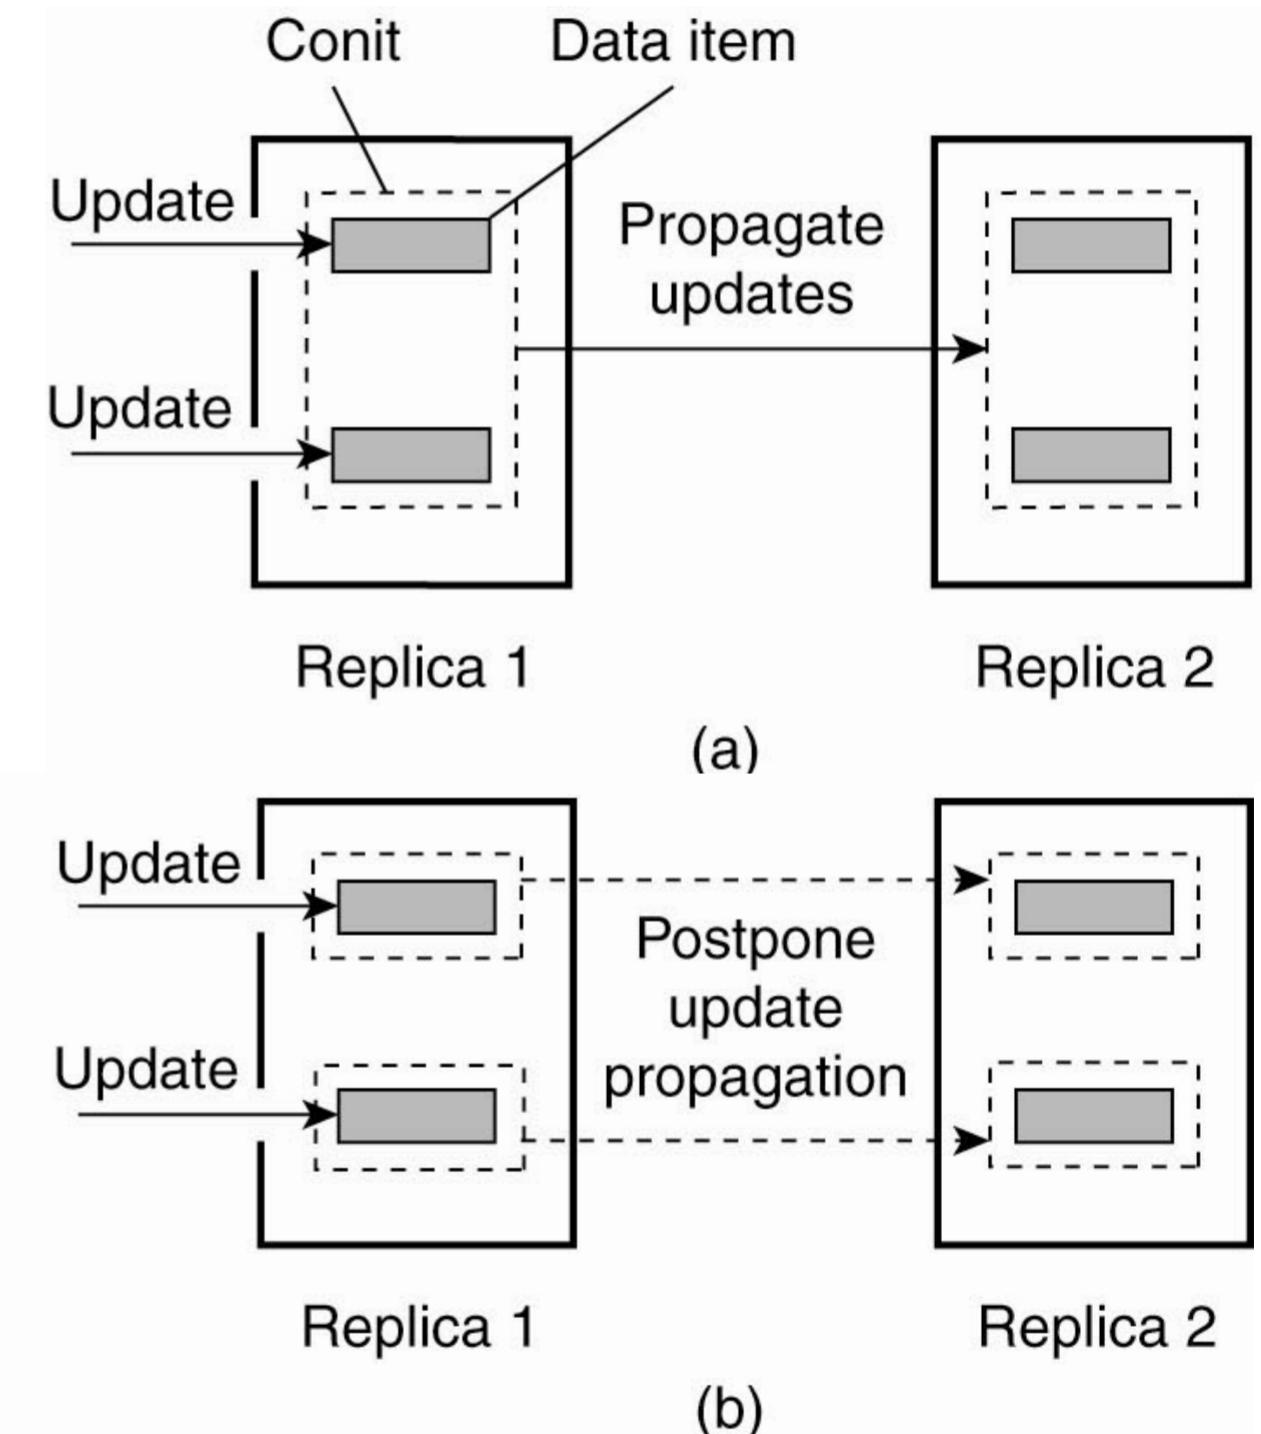

Replica B

Conit	d = 412 // distance g = 45 // gas p = 70 // price
Operation	Result
< 5, B>	g $\leftarrow$ g + 45 [ g = 45 ]
< 6, B>	p $\leftarrow$ p + 70 [ p = 70 ]
< 7, B>	d $\leftarrow$ d + 412 [ d = 412 ]

Vector clock B = (0, 8)  
Order deviation = 1  
Numerical deviation = (3, 686)

# CONTINUOUS CONSISTENCY

- Choosing the appropriate granularity for a conit.
  - (a) Two updates lead to update propagation.
  - (b) No update propagation is needed

# CONSISTENT ORDERING OF OPERATIONS

- Sequential consistency
- Causal consistency
- Grouping operations

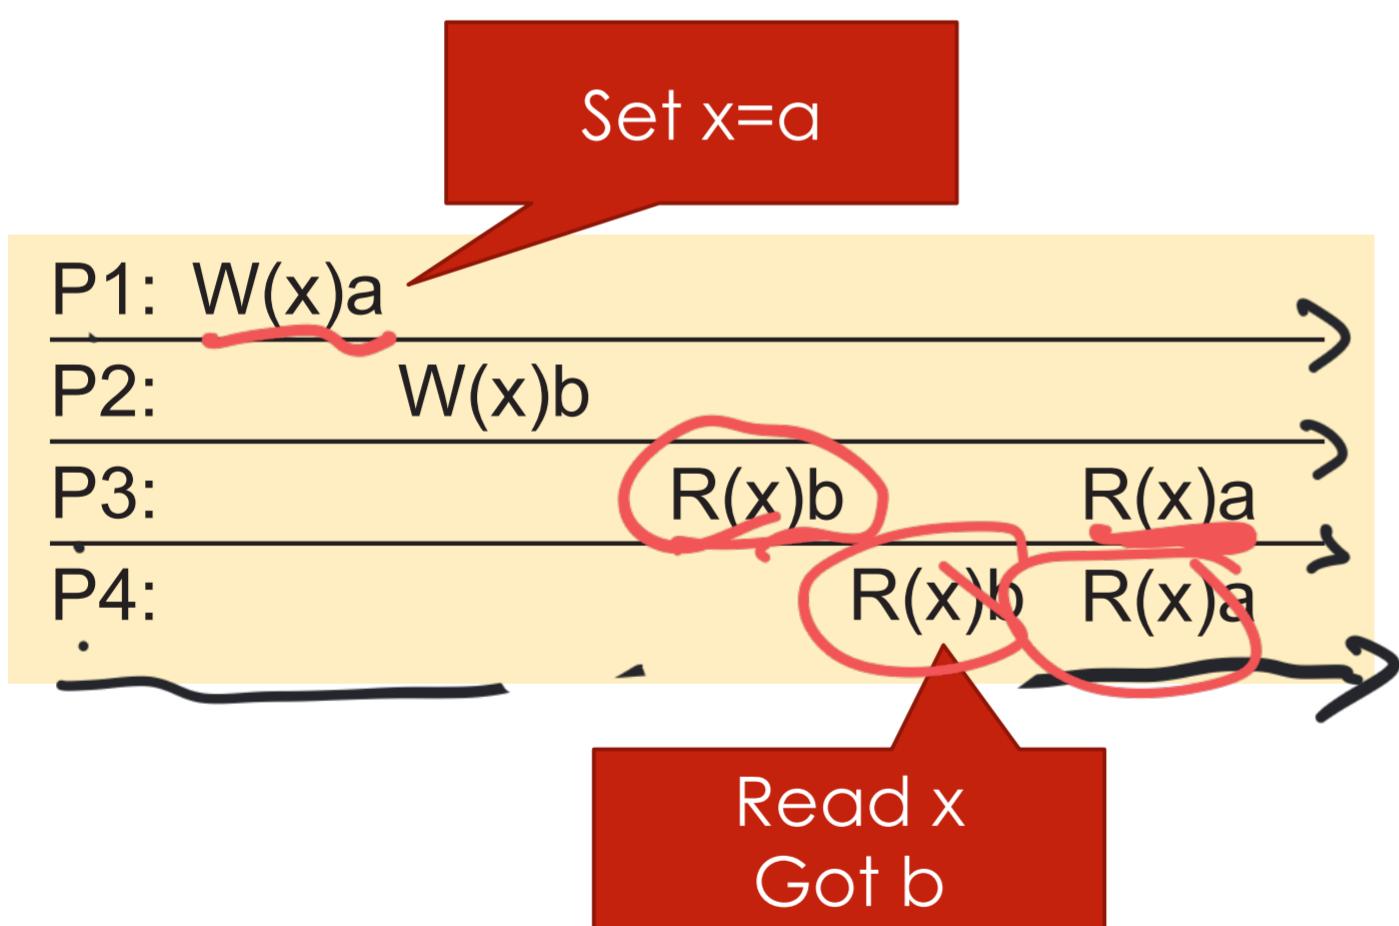

Prof. Tim Wood & Prof. Rozbeh Haghnazar

# CONSISTENCY MODELS

# CONSISTENCY VERSUS COHERENCE

- A consistency model describes what can be expected when multiple processes concurrently operate on a set of data. The set is then said to be consistent if it adheres to the rules described by the model.
- Where data consistency is concerned with a set of data items, coherence models describe what can be expected to hold for only a single data item [Cantin et al., 2005].
- In this case, we assume that a data item is replicated; it is said to be coherent when the various copies abide to the rules as defined by its associated consistency model.

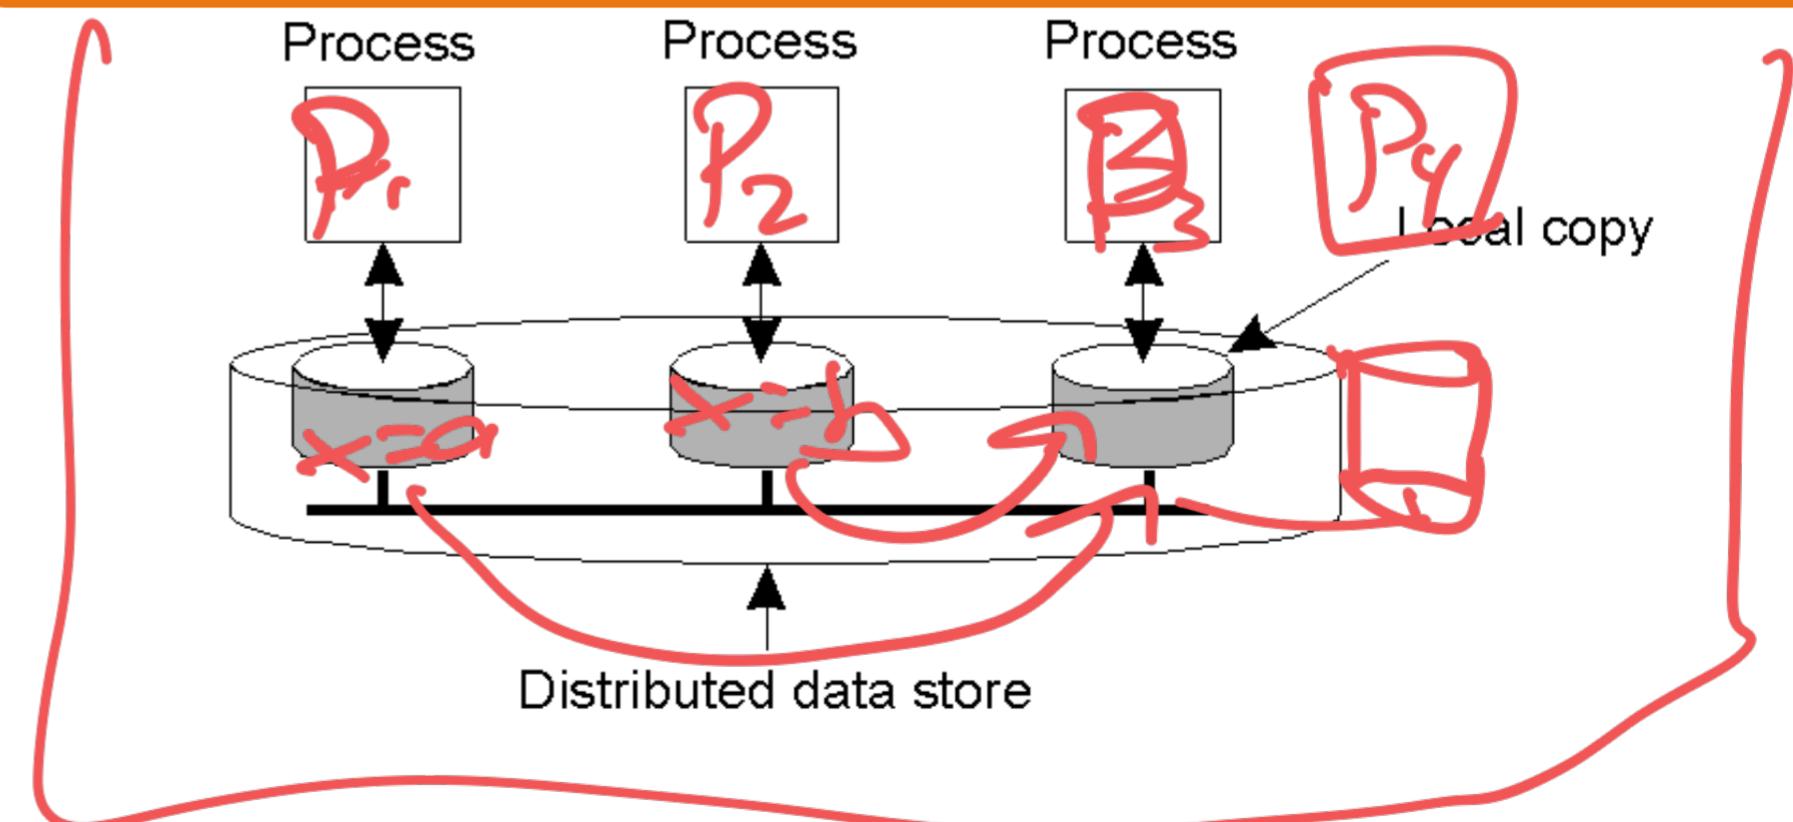

## CONSISTENCY MODEL DIAGRAM NOTATION

$W_i(x)a$  – a write by process 'i' to item 'x' with a value of 'a'. That is, 'x' is set to 'a'.

$R_i(x)b$  – a read by process 'i' from item 'x' producing the value 'b'. That is, reading 'x' returns 'b'.

Time moves from left to right in all diagrams.

# SEQUENTIAL CONSISTENCY

- The result of any execution is the same as if the operations of **all processes** were executed in some sequential order, and
- The operations of each individual process appear in this sequence in the order specified by its program.

**Any ordering of reads/writes is fine, but all processes must see the same ordering**

Prof. Tim Wood & Prof. Roozbeh HaghNazan

The diagram illustrates three execution sequences of four processes (P1-P4) over six time steps. Each sequence is represented as a row of four horizontal lines, one for each process. Operations are labeled with their type (W for write, R for read) and value (a or b). Handwritten numbers 1 through 6 are placed above the lines to indicate the order of operations. Blue letters A through F are placed below the lines to identify specific points in the sequence.

P1: W(x)a <sup>1</sup>	P2:           W(x)b <sup>4</sup>	P3: R(x)a <sup>2</sup> R(x)b <sup>5</sup>	P4:                          R(x)a <sup>6</sup> R(x)b
P1: W(x)a <sup>A</sup>	P2:           W(x)b <sup>B</sup>	P3: R(x)b <sup>C</sup> R(x)a <sup>E</sup>	P4:                          R(x)b <sup>D</sup> R(x)a <sup>F</sup>
P1: W(x)a	P2:           W(x)b	P3: R(x)b <sup>Conflict</sup> R(x)a	P4:                          R(x)a <sup>Conflict</sup> R(x)b

Which are sequentially consistent?

order for  
B → C → D → A → E → F

# SEQUENTIAL CONSISTENCY

- The result of any execution is the same as if the operations of **all processes** were executed in some sequential order, and
- The operations of each individual process appear in this sequence in the order specified by its program.

**Any ordering of reads/writes is fine, but all processes must see the same ordering**

P1: W(x)a

P2: W(x)b

P3: R(x)a R(x)b

P4: R(x)a R(x)b

P1: W(x)a

P2: W(x)b

P3: R(x)b R(x)a

P4: R(x)b R(x)a

P1: W(x)a

P2: W(x)b

P3: R(x)b R(x)a

P4: R(x)a R(x)b

Which are sequentially consistent?

# CAUSAL CONSISTENCY

- Writes that are potentially causally related must be seen by all processes in the same order.
- Concurrent writes may be seen in a different order by different processes.

**Reading a value means your future writes may be causally related to that operation!**

Prof. Tim Wood & Prof. Rozbeh HaghNazan

if writes to the same variable are "connected" by a read

P1: W(x)a

P2: R(x)a → W(x)b

P3:

P4:

R(x)b

R(x)a

P1: W(x)a

P2: W(x)b

P3:

P4:

R(x)b

R(x)a

P1: W(x)a

P2: W(x)c

P3: W(x)b

P4: R(x)c

R(x)b

R(x)a

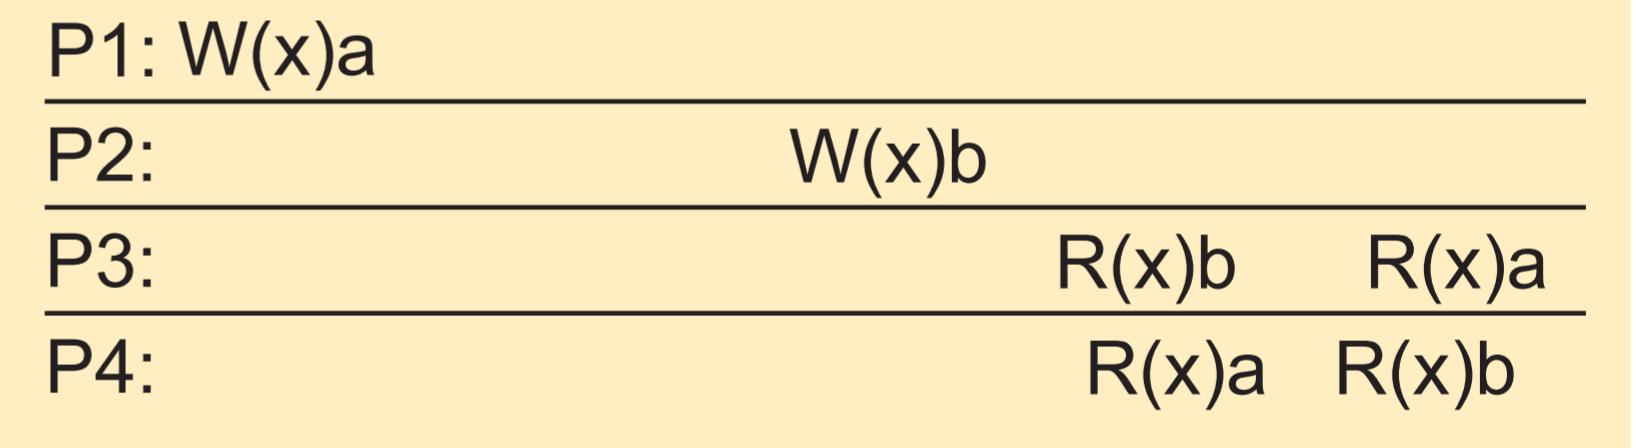

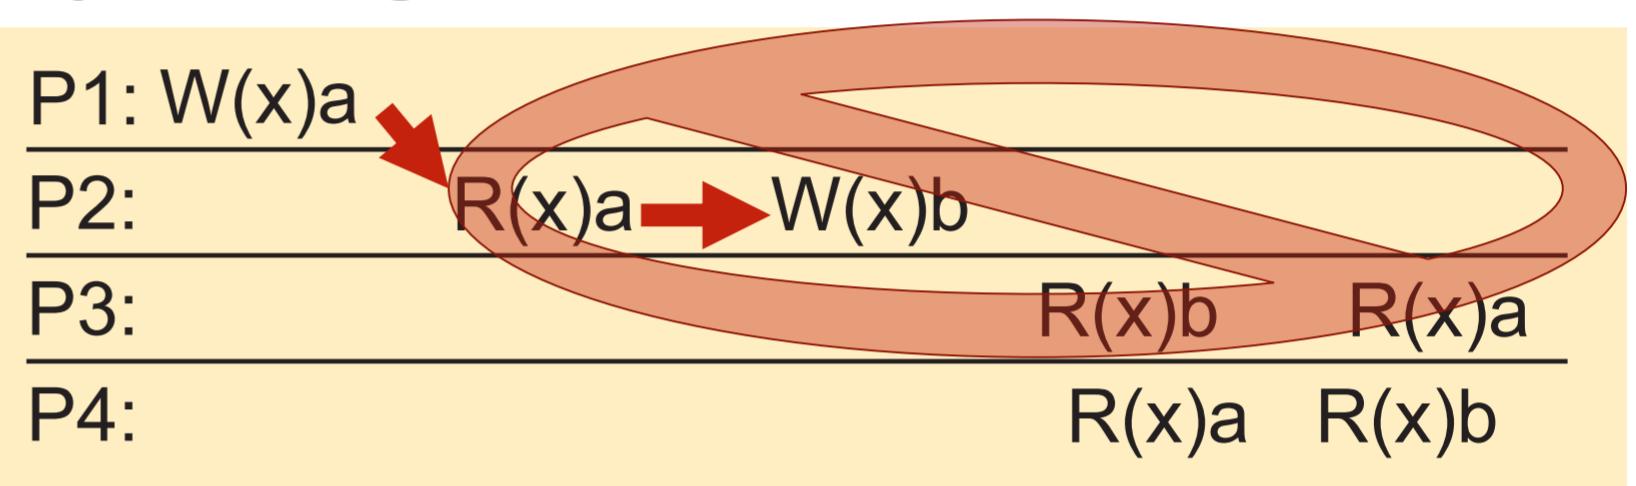

R(x)a

R(x)b

Causal is less strict than seq

# CAUSAL CONSISTENCY

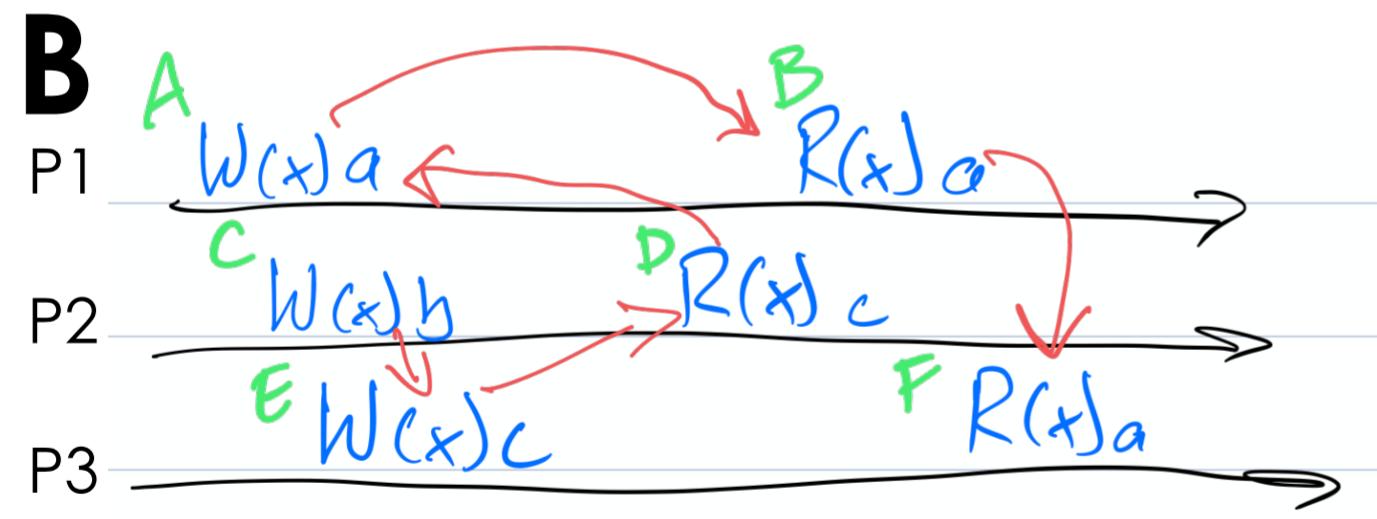

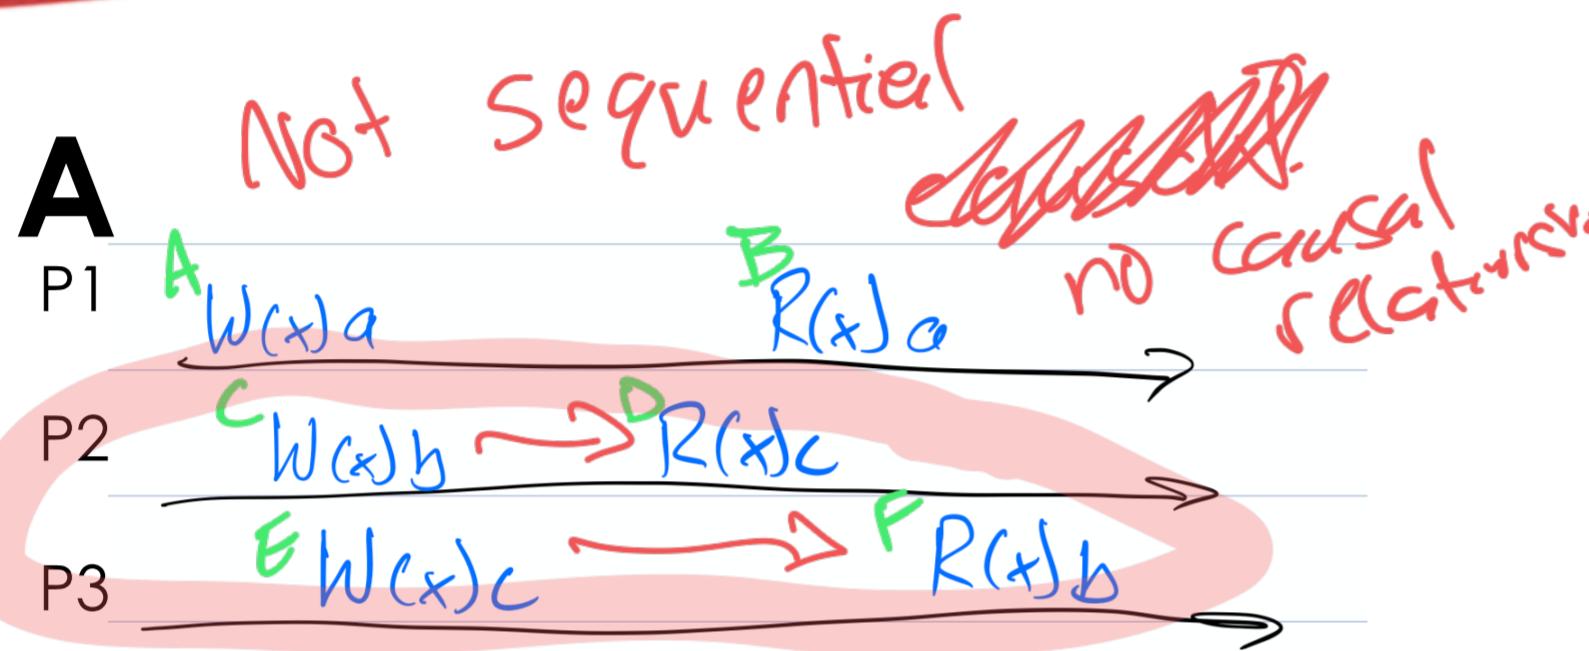

- Writes that are potentially causally related must be seen by all processes in the same order.
- Concurrent writes may be seen in a different order by different processes.

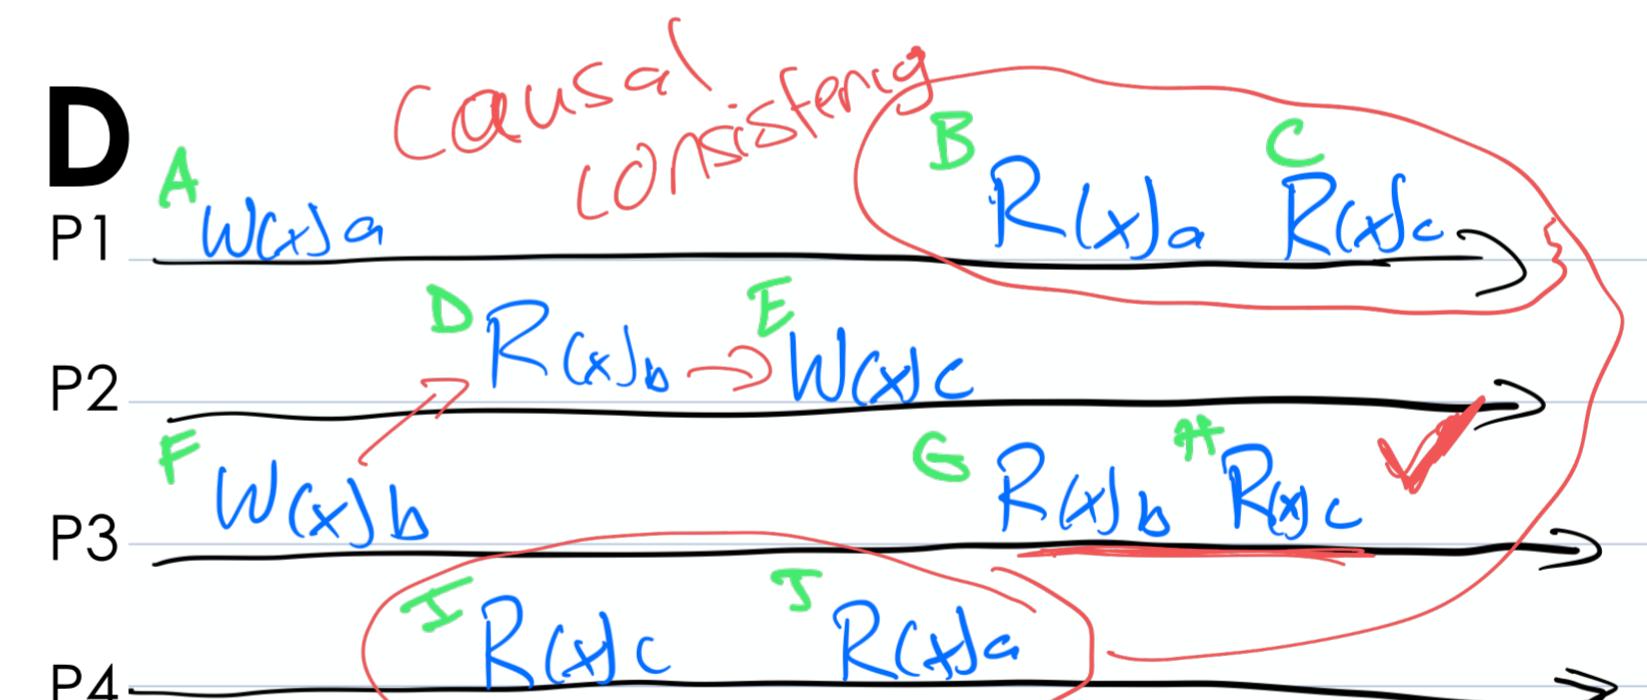

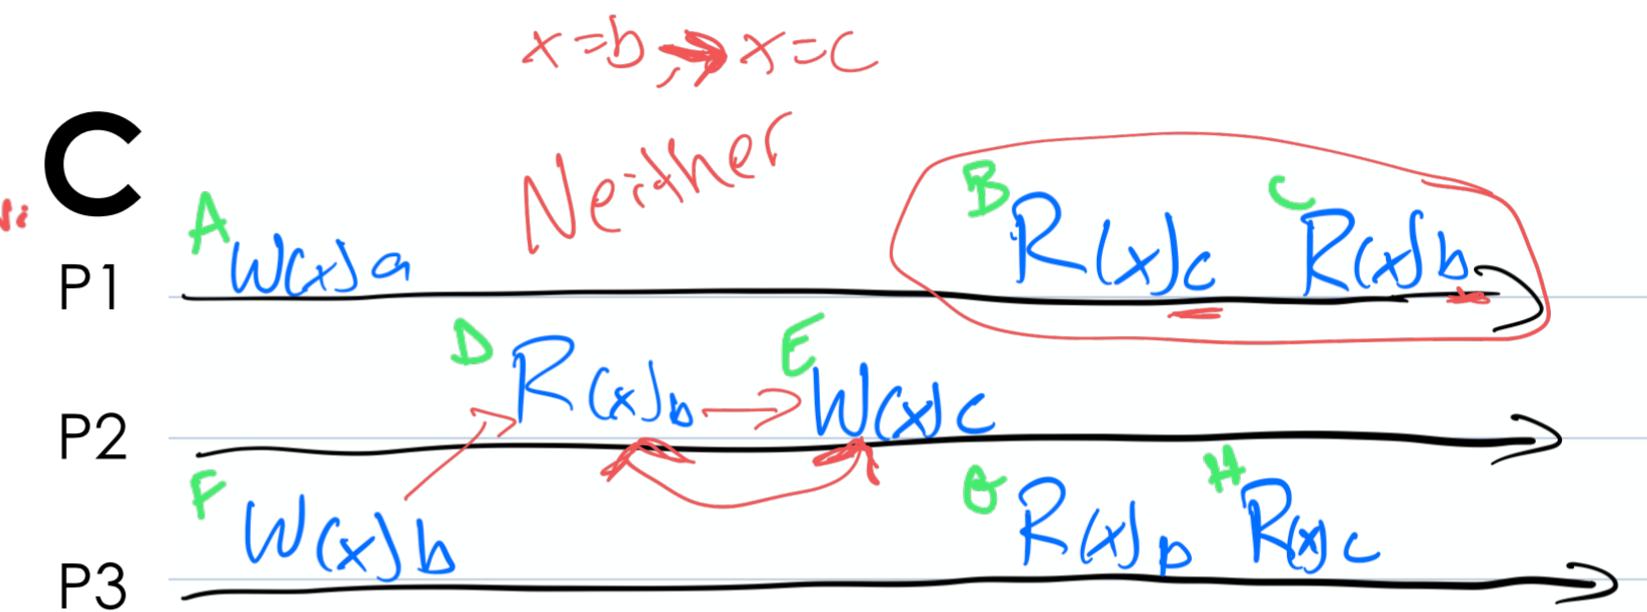

**Reading a value means your future writes may be causally related to that operation!**

# GROUP PROBLEMS

Is each timeline **Sequential**, **Causal**, or **Neither**?

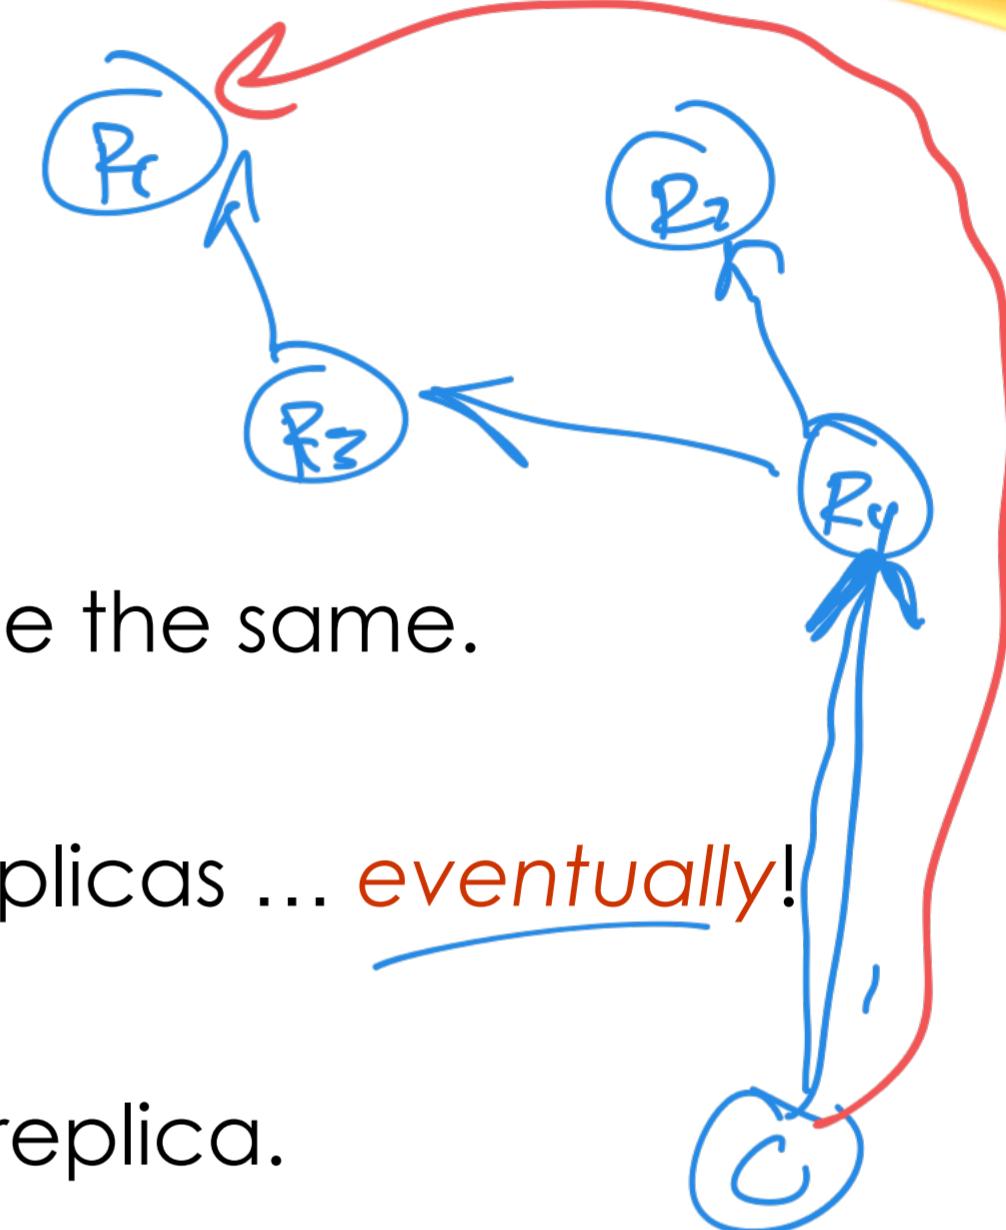

C E D A B F  
Sequential ordering

$x=b \rightarrow x=c ?$

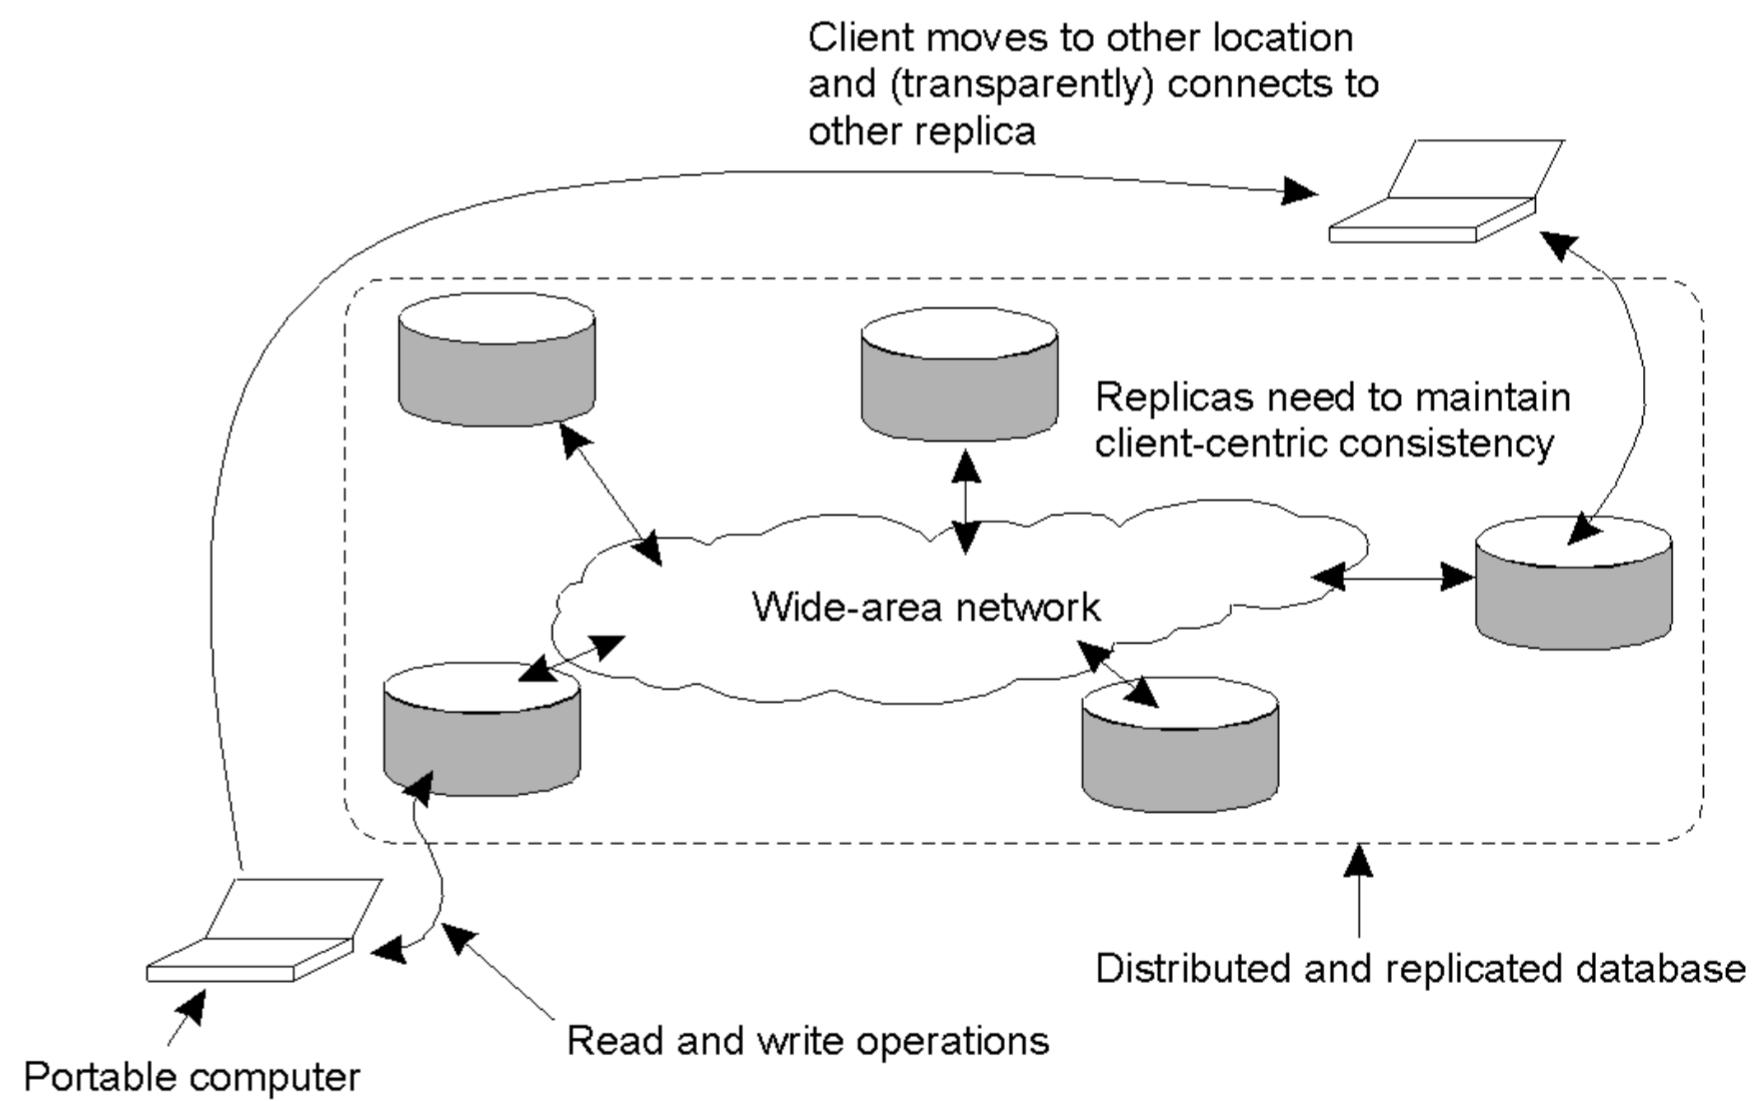

# EVENTUAL CONSISTENCY

- The only requirement is that all replicas will eventually be the same.
- All updates must be guaranteed to propagate to all replicas ... eventually!
- This works well if every client always updates the same replica.
- Things are a little difficult if the clients are mobile.

# EVENTUAL CONSISTENCY: MOBILE PROBLEMS

- The principle of a mobile user accessing different replicas of a distributed database.
- When the system can guarantee that a single client sees accesses to the data-store in a consistent way, we then say that “**client-centric consistency**” holds.

Prof. Tim Wood & Prof. Rozbeh HaghNazari

EXAM

# EXAM DETAILS – 11/12

~60 minutes

- Exam will be during class Thursday November 12, 6:10-8:40PM
- Exam will be on Blackboard
- Exam will be open book and open notes as follows:
  - The Van Steen & Tanenbaum book
  - The slides presented in class
  - Any notes you wrote (typed/handwritten)
- You may **NOT** use any external websites
- You may **NOT** communicate with any other students/people outside class
- Sample questions are on website

Prof. Tim Wood & Prof. Rozbeh Haghnazari

area material covered in  
class up to tonight  
and including
